

GEBRUIKERS CLUB NEDERLAND

TAALPROBLEMEN.

Binnen onze club (en daarbuiten) is een computertaalprobleem aanwezig, dat niets te maken heeft met de computers zelf, maar met alles, wat erover geschreven wordt.

Dit probleem bestaat hieruit, dat veel documentatie van computers, programma's etc. in het engels is. Zelfs in de KIM-KENNER, een blad van een nederlandse club, wordt engels-talige documentatie afgedruht.

Runneg kunnen de meningen over engels-talige documentatie in 2 groepen verdeeld worden. De ene groep bestaat uit meningen in de trant van:

- Wie kent er nu geen engels?

- Wie begint er nu met een computer zonder engels te kennen?

- Engels hun je toch leren?

De andere groep meningen is:

- We zijn toch nederlanders in een nederlandse club?

- Waarom doen ze toch zo overdreven. Spreek je moers taal.

Het probleem als zodanig bestaat alleen voor mensen wiens mening in de tweede groep ligt. Oplossingen, hoe eenvoudig ook te bedenken, werken niet.

In dit stukje wil ik iets tegen beide meningen inbrengen. Misschien helpt het.

Mensen viens mening in de eerste groep valt, spreken engels, dus is het hun probleem niet, vinden ze. Ze worden soms nogal geïrriteerd door "zoiets onbenulligs".

Aan deze mensen vraag ik nu of ze toch de maeite willen nemen om eens na te denken over het feit, dat iemand die een hobbycomputer heeft, hun documentatie (beter) zou kunnen gebruiken, als hij in het nederlands geschreven was.

Denk eens niet alleen aan de lol van een programma schrijven, maar ook aan het plezier, dat iemand anders er van kan hebben.

Mensen wiens mening in de tweede groep valt, zullen meestal de engelse taal niet of nauwelijks meester zijn en voelen zich onmachtig, omdat ze dingen niet "kunnen" lezen.

Aan deze groep mensen vraag ik toch om enige consideratie voor diegenen, die dingen in het engels schrijven in een nederlandstalig blad. De reden hiervoor kan zijn dat iemand zelf uitsluitend vanuit engelstalige geschriften de computer heeft leren beheersen en dus volkomen automatisch computers en engels aan elkaar koppelt. Daar komt iemand niet zo gemakkelijk los van, vooral als hij zijn best doet de dingen zo goed mogelijk op te schrijven.

Wat betreft het vertalen van oorspronkelijk engelstalige copij, zoals de wel eens afgedrukte KIM-hints, zou ik best willen, dat iemand naast de computerhobby een vertaalhobby had en zich aanmeldde voor dit soort zaken.

Een schrale troost: Ik heb zelf enkele jaren geleden met een Israëlische computer gewerkt, waarvan de meeste documentatie in het Hebreeuws (denk ik) was. Ik kon tenminste de letters niet eens lezen en dat is nog veel frustrerender.

	Nummer:
mintion of the 6516 micro processor	Blad: 1/1

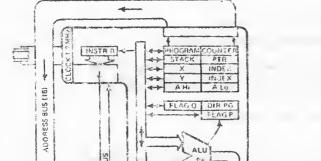

Dascription: Goal is to retain the popular te data width memory space. Result is "psuedo-16" version of 65c a popula, 64k 16-bit data manipulation also.

Status: Concept of the pseudo-16 machine was in original plans of 6502's designers, because it allows for obvious limitations in handling large memory blocks. This design from second-source Synertek has gone through several iterations, but it should finally reach production stage in 1979.

-CHARACTERISTICS

HARDWARE

SOFTWARE

I-DATA-MANIPULATION INSTRUCTIONS

Arithmetic end logical. Decimat mode via control bit in status register. Can operate on locations in memory space (which can be either RAM or t/O ports)

II—DATA-MOVEMENT INSTRUCTIONS

True indexed addressing with X and Y index registers that can operate in either 8- or 16-bit mode for full reach over 64k address space. Short-form addressing to zero page. which can be software-shifted to any page in 64k memory space. Has sophisticated indirect-indexed and indexedindirect addressing modes for handling tables

III-PROGRAM-MANIPULATION INSTR

Conditional branches with signed relative addresses. Some relative addressing with ±32k reach, Nonmaskable and/or maskable interrupt, depending on model. Stack pointer cen be initialized to start LIFO stack anywhere in 64k memory space; stack can be up to 64k deep

IV-PROGRAM-STATUS-MANIP INSTR

Two status registers: one for ALU operations plus a user flag, the other for setting single- vs double-byte modes for **CPU** registers

Push and pull status registers from memory stack. Set and clear carry, decimet mode end interrupt bits. Externat input to one stetus bit, usetut for handshaking with peripherals

The 6516 has the following enhancements compared with the 650X:

1. Bigh bytes have been added to the X, Y index registers, stack point and accumulator

2. ALU (still eight bits) has extension for handling 16-bit increments and decrements

6516

- 3. DP (direct page) register permits software relocation of direct or zero page (so short-form addressing can occur from several
- different pages during course of program execution;
 4. Five additional BRK (break) instructions with new vector locations for these software interrupts, to aid in debugging
- 5. New flag register—O—for 8- vs 16-bit modes for CPU registers. Four bits can software-control whether accumulator; X, Y indexes;
- or memory is handled on single- or double-byte basis, 6516 intelligent enough to work with mixtures of word lengths.

6. Instructions to swap X and Y permit symmetrical indexed-addressing modas

Note: Upon reset, 6516 produces default values in direct page and Q register, so it behaves fike 650X.

Specification summary: Common-memory architecture with full 1.6-bit addressing over 64k memory-I/O spece but with 8-bit byte-oriented data paths end ALU. Has 114 instructions (all but one of the possible 256 opcodes used) executed at 1- or 2-MHz clock rates. Upward compatible wity 650X family in both software (at symbolic essembly-language level, not bit pattern) and hardware (can use 650X-or 3800-peripherals). NMOS silicongate depletion-load technology on chip, initially estimated 210 mils ag, requires one +5V supply. Housed in 40-pin package

-SUPPORT

-HARDWARE

-SOFTWARE

Development system: Because 6516 is upward compatible with 650%, it will be able to use the System 65 dual-floppy development system (\$5400 for 1 MHz, \$3130 for 2 ktHz). he 6516 will probably have its own in-circuit-emulation attachment for System 65 as well as it a usual range of prototyping and OEM boards. Development software: Because 6516 is only symbolicassembly-language compatible with 650X, it will need translator software to use 650X programs. More importantly, to use 6516 enhancements, there will have to be 6516 cross assemblers to run on System 65, etc.

KIN APLLICATION NOTE NR 111477	Number:
USING HIM AS A DEDICATED CONTROLLER	Blad: 1 OF 3

Introduction .

The KIM-1 microcomputer board can be used as a very low cost development system for application programs of up to about 512 bytes in length. Additionally, in low volume applications, the KIM itself can serve as the controller with the addition of a programmable read only memory (PROM), a power-on-reset modification, and some additional circuitry to transfer control to the added PROM upon power-up.

Besides being a cost effective method of getting a small number of dedicated controllers on the job very quickly, this approach has the added advantage of making the KIM operating and debug software available at the controller site. Power-on-Reset Modification

The easiest method of getting KIM to automatically reset itself upon power-up is to disconnect the side of capacitor C-3 (on the KIM board) that normally goes to ground and connect it to +5 volts.

Power-on reset will eliminate the need for manual reset after a momentary power loss or complete power failure.

PROM Selection

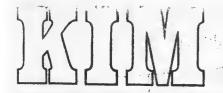

If the control system must operate with a single power supply voltage, then a bipolar fusible-link PROM would be the best candidate for the storing application program.

Memory Expansion

The KIM-1 microcomputer provides 4K of contiguous expansion area (0400 - 13FF) which can be utilized for the added PROM memory.

Without any added buffering circuitry, KIM's expansion bus address lines (except for AB10 - 12) and data lines can drive up to about 1 TTL load and 100 pf of capacity. (30 pf of the original 130 pf drive capacity is used on-board.)

ingang:	Vervangt:	d.d.:	Ref.:
14th NOV 1977			MOS TECHNOLOGY

KIM APPLICATION NOTE NR 111477	Nummer:
	Blad: 2 OF 3

The extra memory must be addressed such that the highest six locations of the particular 1K block chosen hold the interrupt vectors which point to the application program.

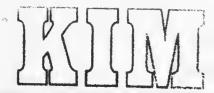

In our example system (see Fig. 1) a 512 × 8 tri-state PROM is placed in the decoded K4 section of KIM memory (see KIM-1 User Manual, p. 38), addresses \$1200 - \$13FF. The top six addresses \$13FA - \$13FF hold the new system interrupt vectors.

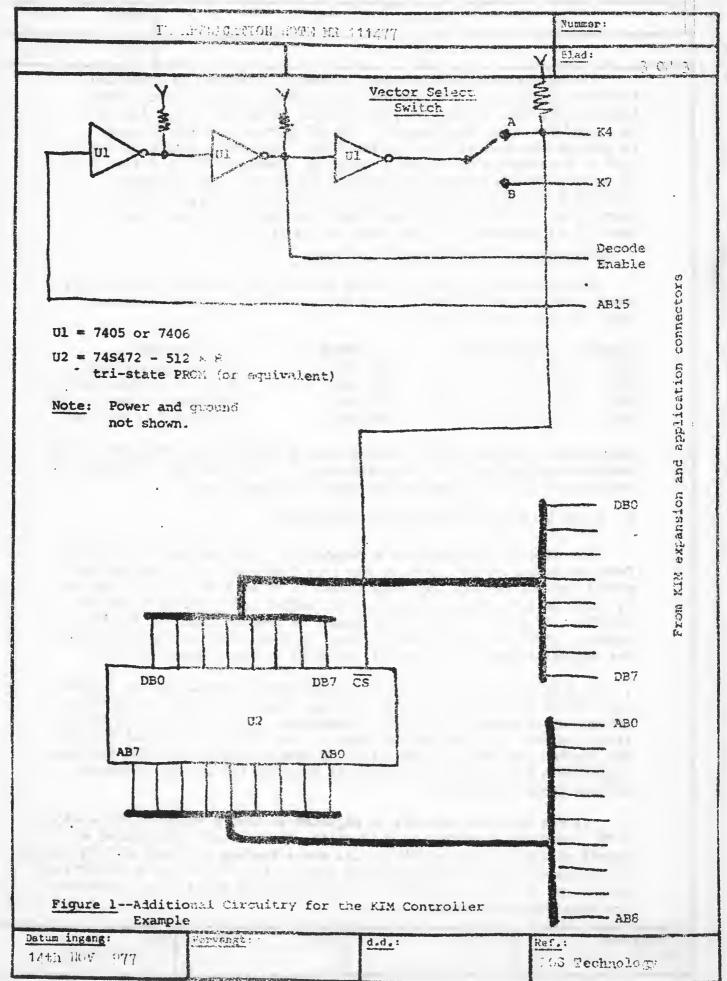

Although the PROM is set up to be addressed at \$1200 - \$13FF it will also "seem" to reside at \$1000 - \$11FF. This is because it hasn't been completely decoded. If memory space is at a premium the PROM can be fully decoded by letting the PROM chip select (CS) pin go low only when K4 is low and address line AB9 is high. This would require extra hardware.

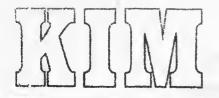

Alternative Vector Selection

The address decoder (U4 on the KIM board) is now de-selected using the AB15 signal which is "true" whenever an interrupt vector fetch is initiated by the system (see Fig. 1). The same signal (AB15) is inverted and "wire-or'd" through a switch to the K4 or the K7 select lines. Now, depending upon the position of the switch, interrupt vectors will be fetched from the top six addresses of either block K4 or K7. K4 in the KIM system selects the added PROM and K7 selects the ROM in the 6530-002 array (the KIM monitor program). In this way you have two different sets of interrupt vectors in your system and may switch-select which set is to be used.

DA and D conversion using KIM	Nummer:
	31ed: 1 of 7

A Motorola 1408 8-bit digital to analog converter is connected as shown in the circuit diagram. The 1408 is available from James Electronics, 1021 Howard Ave., San Carlos, CA 94070, as are the opam; s used in these experiments.) The PAD port of the KIM is used to provide the digital input to the 1408. The analog output of the 1408 is a current sink at pin 4, which we converted to a voltage by means of the PCA CA3140 operational amplifier. The feedback resistor R is adjusted to give the desired voltage output. For example, an R of about 500 chms gives a voltage range from 0 volts when PAD is 00000000 to 1 volt when PAD is 11111111.

1. GENERATION OF A RAMP VOLTAGE WAVEFORM

For the first experiment do not connect the second op amp, simply connect the output of the first op amp to an oscilloscope as shown. Load the following program.

ADDRESS	INSTRUCTION	MNEMONIC	COMMENTS
0300 -	A9 FF	LDA #FF	255 in accumulator.
0302	8D 01 17	STA PADD	Port A is output port.
0305	EE OO 17 BACK	INC PAD	Increment number in PAD.
0307	4C 05 03	JMP BACK	Increment is in loop.

Running this program should cause a ramp waveform to be observed on the oscilloscope screen. A close examination of the ramp will show that it consists of $2^{\circ} = 256$ steps rather than a straight line.

2. A DAC AS AN ANALOG TO DIGITAL CONVERTER

The second op amp acts as a comparator. It compares the voltage from the output of the first op amp (which we shall call the digital signal) with a voltage from some source to be applied to pin 3 (which we shall call the analog signal). The output is connected to PB7 on the KIM. If PB7 = 1, the analog signal is greater than the digital signal. If PB7 = 0, the analog signal is less than the digital signal. The digital signal is, of course, produced by the contents of PAD.

A flow chart showing what we intend to do is shown below. Output port PAD is set to zero. If the analog signal is positive the PB7 = 1. PAD is now incremented untill the comparator indicates that the analog signal is less than the digital signal, i.e. PB7 = 0. At that instant the digital and analog signals are the same to within one bit, the least significant bit, on PAD. The digital value of PAD is then displayed and the cycle continues.

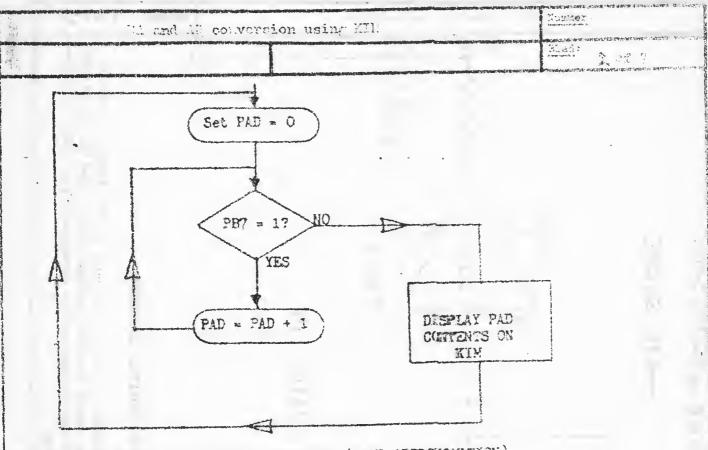

If the feedback resistor is adjusted so that a value of PAD = 25510 = FF, produces a voltage of 2.55 volts, then we have constructed a simple digital voltmeter with a full scale reading (in hex) of 2.55 volts. The extremely high impedance of the 3140 op amp makes this a rather good voltmeter. A simple program to convert from hex, to base ten would make the meter easier to read.

0315	20 1F 1F 4C 05 03	JMP AGN	in KIH monitor, start agaza.

3. SUCCESSIVE APPROXIMATION ANALOG TO DIGITAL CONVERTER USED AS A STORAGE SCOPE

The ramp approximation is quite slow and there is a faster technique known as "successive approximation." It works as follows: the most sign, figural bit to the DAC is set to one and all the others are set to zero. If the comparator indicates that the analog signal is greater than the digital signal, the next lower bit is set to 1 and the test is repeated. If the comparator indicates that the analog signal is less than the digital signal the highest bit is made zero, and the next lower bit is need to 1 and the test is repeated. This iterative process is repeated untill all eight bits have been tested, starting with the MSB and ending with the LSB. The flow chart indicates how this will be accomplished.

This analog to digital conversion scheme will be used in a program which digitizes 256 points on a waveform and then stores the results, to be displayed at a convenient time and with as many repetions as desired on an oscilloscope. It is useful for examining slow waveforms with an oscilloscope with a low persistance screen, for example ECG waveforms, and it is useful for examining non-periodic waveforms such as a one-shot impulse from an accelerometer. The program has triggering built in, and the output scan portion syncronizes the oscilloscope with a sync signal, turning an friexpensive scope into something more useful. A flow chart for the program is given below. The digitize box is the flow chart on page 4.

DA and AD conversion using KIN	Rumer:
DA SING AD CONVESTOR SING ALM	Blad: 6 of 7
OWCHART FOR DISPLAY	
SET X = 0	
SYNC SCOPE	
PUT	
TABLE(X) INTO PAD	
X = X + 1	
NO YES	
NO X = 0 YES	

A short description of the behavior of the circuit and program follows. The experimenter chooses the desired trigger level and loads this into location 0306. When the analog signal is greater than this, the comparator makes PB7 go high and the scan begins. The sampling rate and the scan time is determined by the number loaded into the timer and the timer used; locations 0314 and 0316, respectively. It takes at least 200 microseconds to digitize so there is no point in choosing time intervals smaller than this. It is used as an index to identify each of the 256 points on the scan. After the timer is started the analog signal is digitized and the timer is watched untill it is finished. X is then incremented and a new point is digitized untill all 256 points are finished and stored in TABLE, X. X is then zero again. This entire process will repeat unless the 1 key is depressed, in which case the program displays the data on the oscilloscope, connected as before to the output of the first op amp. The display will repeat, complete with SYNC signal output from PBØ, untill the program is halted. In our case we loaded the vector 17FA and 17FB with the starting address of the program (0300) so a depression of the ST key caused the entire program to start over.

A listing of the program is shown on the following page. Hotice that the data is stored in TABLE, X located in page 2 of memory, PGZZ is at location 0000, the trigger level is in 0306 and the scan time variable is in 0314 and 0316. The scan time should not be shorter than 200 microseconds. As far as display is concerned, we found that a sweep rate of 200 to 500 microseconds per cm gave good results.

				1					ideas for this

A few other comments may be in order. First, most of the ideas for this project were obtained in a KIM workshop offered by Dr. Robert Tinker. The software implementation is the author's work. There are some obvious improvements, such as a sample and hold device between the analog source and the comparator or a faster approximation routine. These improvements are left for the reader to implement. The author would be glad to be informed if such improvements are made.

1FE7	TABLE	Table Hex to 7 Segment	Table Hex to 7 Segment	

KIM Application Note Nr. 771121	Nummer:
Software routines for TVT	Blad: 1 of 5

Abstract: A machine language program is described, occupying less than one page of memory, which emulates terminal operation with an external keyboard and 16 × 32 video RAM. The software includes cursor capability and scrolling. It occupies memory locations 0200 through 02A7 but may be easily relocated.

Figure 1 is an assembler listing of a TV Terminal for KIM when using an attached video memory. The video RAM used in this example is the Kent-Moore Alpha Video Module (Kent-Moore part number 66083A). Any similar 16 × 32 video RAM should work equally well.

The external keyboard is connected to the KIM PA port, with PAØ connected to the least significant bit of the ASCII output from the keyboard and
PA6 connected to the most significant bit. The keyboard's strobe line is
connected to PA7. This software is intended for use with a keyboard where a
positive strobe indicates key depression. Changing lines 452 and 460 will
allow operation with a negative strobe.

Software Description

The software package consists of three main subroutines and two support subroutines. GET, entered at 0271, gets a single character from the keyboard and returns it in the accumulator. All processor registers are protected.

PUT, entered at 0289, places the ASCII character in the accumulator on the

Datum ingang:	Vervangt:	d.d.:	Ref.:

KIM application note	nr. 771121	Nummer:
Software routines for TVT		Blad: 2 of 5

screen in the next available screen location. All registers are protected and the software will automatically scroll to the next line if more than 32 characters are typed on a line or a carriage return is indicated. Control characters (those with an ASCII code below 20) are ignored.

CLEAR, entered at 0256, is a stand-alone routine which clears the screen.

The Y register is affected.

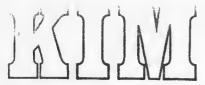

Subroutine Usage

A set of test routines is included in locations 0000 through 0011. A value of zero is loaded in PTY to place the cursor at the beginning of the line. The CLEAR routine is then called to clear the screen and the successive calls are made to GET and PUT to type characters on the screen. It should be noted that this software allows "full duplex" operation because the GET routine does not put characters on the screen.

The user should be aware that the 32 memory locations immediately above the video RAM memory space will be affected by this software and should not be used. This software also assumes that the PA port is configured for input as it normally will be after reset. Also note that all text entry to the screen begins with the bottom line and is scrolled upward. These routines may not be put in ROM because self-modifying code is implemented at lines 130 and 140 which affect the contents of lines 155 and 160. In addition, four temporary memory locations are used (lines 260 - 275), although these could be moved.

Figure 2 is a hexadecimal dump of the object code for the program.

KIM Application Note	Nummer:	
S-100 to KIM-4 bus adapter		Blad: 1 of 4

The Kent-Moore Instrument Co. manufactures a video display board (#60083) and a 4K static RAM board (#60082) which, although originally intended for the S-100 bus, can be made electrically and mechanically compatible with the KIM-4 motherboard.

This application note will describe the electrical and mechanical interface necessary to get these two particular S-100 bus-compatible boards "on-line" with the KIM system.

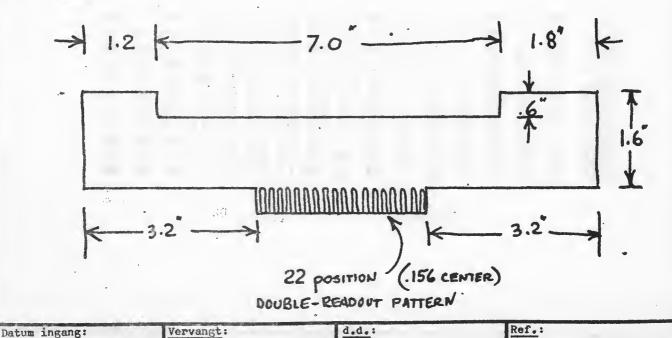

Although it can be seen that other S-100 type boards can also be made compatible, it is beyond the scope of this application note to describe their full implementation.

1) Mechanical Interface

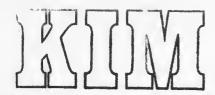

2nd October 1977

The first step will be the description of the adapter board necessary to mate a 100-pin wire-wrap style connector to the 44-pin configuration of the KIM-4.

The card guides on the motherboard can be used without adjustment since they are exactly the same width (10") as the S-100 size cards.

3) Necessary Board Modifications

- A) Kent-Moore Alpha-VDM (#60083): Install a jumper from V15 pin #2 to V11 pin #4.
- B) Kent-Moore 4K RAM (#60082): Install a jumper from V32 pin #9 to V32 pin #3.

A jumper must be added to each board to provide that board with inverted R/W which is not normally available on the KIM-4 bus.

Alpha-Video **Display Module**

The Alpha-VDM generates sixteen 32character lines in a large easy-to-read format with both upper and lower case letters. It contains 1K (1024) bytes of random access memory, to which the processor can read or write, just as though the memory were an integral part of the system. As the information is written, the contents of this on-card memory are displayed instantly without interrupting the operation of the processor.

All timing required to generate a standard video signal is provided by a crystal oscillator and associated digital circuitry. Centering of the display on the monitor screen is controlled by driftfree counter logic.

The 1K by 8 static display memory buffer is directly addressable as RAM on the S-100 bus. Displaying data on the screen is accomplished by moving the data to be displayed in the first 512 bytes of the Alpha-VDM memory. Therefore the display update is essentially instantaneous. Output routines can make use of all Memory Reference instruction, including one byte moves. (i.e. MOV M, reg.) Multiple programmable cursor circuitry is built in. All 52 cursors can be displayed at one time, and anywhere in the display. Thus, the VDM can display white-on-black or blackon-white - perfect for many video games! The VDM also features EIA Video output for any standard video monitor, or a TV repair shop can easily modify your own set.

The VDM comes with free terminal mode software, designed for teletype replacement.

SPECIFICATIONS

16 lines of 32 characters, upper Display and lower case, with descenders. Format

Control characters visible as abbreviations. See options.

EIA composite video, Ivpp nominal, 75 ohms 3.4 Mhz. Output

ASCII data written into RAM Input memory on card. Bit 7 sets cursor at character location. Processor may read contents of

on-card. RAM memory. RAM contains 1024 bytes. (512 on

screen)

Solid video inversion block (black Cursor

character on white background) superimposed over each charac-

ter having bit 7 set to' Any 1K page may be selected Address for memory address. Selection Selection is performed by Visaddress 19

switch on card.

506 MA nominal Vcc, 6V to 10V Power

712 MA Maximum Vcc, 6V to 10V

3 fonts available, (A: Graphics Options font, B: Greek font, C: ASCII

Control font) Logic Sync. generator for crystal controlled

stability

Physical 5/3" x 10.0"

Alpha-Video Display Module

(PART NO. 60083A, B or C) \$107.00

Dimensions (13.46 cm x 25.4 cm)

Plug-in compatible with Altair Rus 8800 or IMSAI 8080 bus. (S-100). **Pinout**

•	PATCHES OP MICRO ADE	Nummer:
Inleiding		Blad: 1 van 31

DE PATCHES OP MICRO-ADE ZYN VERDEELD OVER 5
GROEPEN FILES. EEN DEEL VAN DEZE PATCHES ZYN REEDS
IN DE KIM-KENNER (5) GEPUBLICEERD, EEN DEEL IS EEN
VERDERE DOORVOERING VAN DE GEPUBLICEERDE WYZIGINGEN,
EEN DEEL IS EEN ANDERE OPLOSSING VOOR DE GEPUBLICEERDE
WYZIGINGEN EN TENSLOTTE ZYN ER EEN STEL NIEUWE
COMMANDO'S INGEBOUWD EN VERDERE VERBETERINGEN
AANGEBRACHT.

BY HET INVOEREN VAN DE PATCHES MOET ER WEL REKENING MEE GEHOUDEN WORDEN, DAT 1. IN IEDERE VOLGENDE GROEP FILES ER VAN UIT GEGAAN WORDT, DAT DE VORIGE GROEPEN PATCHES AANGEBRACHT ZYN EN 2. DAT SOMMIGE VAN DE PATCHES NOODZAKELYKE VERBETERINGEN ZYN OP VORIGE PATCHES. (DEZE ZYN EVT TE VERWEVEN IN DE FILES WAAR ZE IN THUIS HOREN)

KORTE PESCHRYVING VAN DE GROEPEN FILES :

GROEP1.

ONDERDRUKKEN VAN PRINTEN VAN 'ID=' OMDAT DIT DE LISTINGS ONTSIERT.

VERFRAAIEN VAN DE KOP EN 1 SPATIE-REGEL NA DE KOP PRINTEN.

PRINTEN VAN DE *-REGEL VERFRAAIEN.

PAAR EENVOUDIGE FOUTJES IN MICRO-ADE VERBETEREN TOEVOEGEN VAN ROUTINE OM AAN CTRL-C DEZELFDE FUNCTIE TE GEVEN ALS HET APESTAARTJE EN OM CTRL-U DEZELFDE FUNCTIE TE GEVEN ALS SHIFT-L (VOOR TOETSEN BORDEN, WELKE APESTAART EN SHIFT L MISSEN).

GROEP2.

VERANDEREN VAN STARTEN/STOPPEN TAPE-RECORDERS BY
DE READ FN WRITE (BY DE WRITE WORDT VOOR EN NA HET
DUMPEN 1 A 1.5 SEC GEWACHT OM DE SNELHEID VAN DE
TAPE-RECORDERS CONSTANT TE KRYGEN; P80 EN P81, DIE
GERRUIKT WORDEN VOOR DE START/STOP VAN DE BEJOE
TAPE-RECORDERS, WORDEN OP EEN ZODANIGE WYZE BEDIEND,
DAT P82 TM P87 NIET BEINVLOED WORDEN).

TOEVOEGEN VAN DE MOGELYKHEID OM DMV G NN-MM MEERDERE FILES ACHTER ELKAAR IN DE SOURCE-BUFFER TE KRYGEN EN DAARNA EEN AUTOMATISCHE BENUMBER TE STARTEN.

GROEP3.

TOEVOEGEN VAN HET LT-COMMAND , DI. HET ONDERDRUKKEN VAN DE REGELNUMMERS.

HET ONDERDRUKKEN VAN DE VELE CRLF'S (EEN DEEL HIERVAN IS TE VINDEN IN DE KIM-KENNER, FEN DEEL ZYN TOER NIET VERMELDE PATCHES).

TOEVORGEN VAN V-COMMAND. HET V-COMMAND MAAKT HET MOGELYK OM TE SCANNEN OP EEN PEPAALDE

Datum ingang:	Vervangt:	d.d.s	Ref.:	
19-03-1979			S. Woldringh	

	PATCHES OP MICRO ADE	Nummer:
Inleiding		Blad: 2 van 31

CHARACTER-STRING EN DEZE TE VERANDEREN , DAAR WAAR HY VOORKOMT , IN EEN ANDERE CHARACTER-STRING.

GROEP4.

TOEVOEGEN VAN HET H-COMMAND. VIA HET H-COMMAND KUNNEN FILES ACHTER REEDS BESTAANDE SOURCE GELADEN WORDEN.

TOEVOEGEN VAN DE MOGELYKHEID OM DE TAPE-ID NIET
TE VERGELYKEN MET EEN OF ANDERE OPGEGEVEN ID (GOO, HOO)
VERBETEREN VAN BEREKENEN VAN RELATIEVE ADRESSEN.
TOEVOEGEN VAN EEN CHECK OP HET ARGUMENT
VAN EEN OP-CODE.

VERBETEREN VAN EEN FOUTJE , DAT GESLOPEN WAS IN DE CODERING VAN HET V-COMMAND.

GROEP5.

PATCH OP HET V-COMMAND OM HET MOGELYK TE MAKEN, DAT DE TE VERANDEREN TEKST DEEL UIT MAAKT VAN DE NIEUWE TEKST (BV V 'LDA' ' LDA').

DEZE PATCH IS NIET NOODZAKELYK, DOGH WORDT HY NIET INGEVOERD EN EEN V-COMMAND ALS HIERBOVEN WORDT INGETIKT, DAN KAN EEN ZEER LEUK EFFECT TE ZIEN ZYN EN IS DE SOURCE-FILE NIET MEER TE GEBRUIKEN.
